US Precious Metals Inc. Announces Phase II Development to Begin Immediately on its Michoacán, Mexico Property

MARLBORO, New Jersey, September 24, 2013 /PRNewswire/ --

US Precious Metals, Inc. (OTCQB: USPR) in conjunction with our its Joint Venture partners Mesa Acquisition Group LLC/Alba Petroleos De El Salvador Sem De Cv, is pleased to announce the immediate commencement of Phase II development on its Michoacán, Mexico property.

George Mesa, President/CEO of Mesa Acquisition Group stated "Not only did the satellite imaging confirm previous areas indicated in the previous drilling programs, it also uncovered new areas of high intensity gold reserves." He continued; "As you know, I have been studying the property, core samples, drilling programs with Mr. Serrat, Mr.Figuero, and my partners for more than a year now. This confirmation was more than enough for us to move forward. We will begin Phase 2 immediately and based on the unexpected results, we are also in internal discussions with our partners with a view to putting together a package to exceed the previous amounts contemplated for Phase III."

Phase II will include applying the Forming Short-Pulsed Electromagnetic Fields (FSPEF) and Vertical Electric-Resonance Sounding (VERS) on a majority of the 2,134 acres. The FSPEF technology will be even more detailed than the high spectrum UV laser satellite imagery, honing in on the proven deposits and the VERS technology will identify volume and depth of mineralization in all areas of interest. Together when completed, these technologies will provide a proven reserve estimate in grams of Gold per ton of ore body.

In addition, The Mesa Acquisition Group is currently speaking with the relevant government bodies regarding road permits, hauling routes, water, and electric as well as all environmental requirements to facilitate Phase II development. They also have begun identifying the necessary equipment and earthmovers that will be brought to the site.

The satellite imaging covered 2,134 acres of the Company's 37,000 acres or 5.7% of its property. The purpose of the imaging was to confirm existing geology developed by Mr. David Burney, USPR's geologist through 2 drilling programs and on-site mapping and sampling, and to identify further areas of potential interest. Both of these goals were achieved with this imaging program. The satellite imaging identified 27 gold anomalies of which numerous showed high intensity levels. A total of 217 surface acres were identified by the 27 anomalies.

Mr Jerry Pane Chairman and CEO stated: "After many years of hard work, I am thrilled that our results to date have greatly exceeded expectations and we are now in the

position to begin Phase II of our development program with the Mesa Acquisition Group." Mr Pane continued, "This is an extremely exciting time for our company and shareholders, we are looking forward to quickly completing phase II and moving speedily into Phase III which of course is the mining of the property".
