Resonant Expands Fabless Filter Eco-System with Signing of First ISN Foundry Agreement with Independent Backend/Packaging Partner

GOLETA, CA -- (Marketwired) -- 11/27/17 -- Resonant Inc. (NASDAQ: RESN), a designer of filters for radio frequency, or RF, front-ends that specializes in delivering designs for difficult bands and complex requirements, today announced that it has signed its first Infinite Synthesized Network® (ISN®) Foundry Agreement with an established independent packaging partner serving the RF market.

The package vendor, which serves Tier 1 RF front-end customers, is a leading provider of specialized development and manufacturing of custom semiconductor micro module assembly, and thick film and thin film substrate foundry services. Leveraging Resonant's ISN® Foundry Program, this agreement expands Resonant's fabless filter eco-system, providing licensees with backend and packaging services in the emerging module market.

"With the signing of another eco-system partner for our fabless-foundry program, we are giving our licensees additional choices for backend and packaging capabilities," said George Holmes, CEO of Resonant. "We continue to build upon our business model, which is focused on enabling established suppliers to enter and potentially disrupt the massive filter market. By providing quality supply chain options for our customers, we look forward to accelerating revenue growth and continuing to increase shareholder value."

Holmes, continued: "The strategic importance of a stable supply chain for such a critical component to the mobile market is recognized by our partners. Increasing filter complexity demands quality partners capable of high volume production."

For more information related to filter functionality and the effect of increasing data-rates, see the Company's most recent video titled, "What is a filter?" The video can be found by clicking [here](#), or via the following link: <https://ir.resonant.com/videos>.

About Resonant Inc.

Resonant is creating software tools and IP & licensable blocks that enable the development of innovative filter designs for the RF front-end, or RFFE, for the mobile device industry. The RFFE is the circuitry in a mobile device responsible for the radio frequency signal processing and is located between the device's antenna and its digital baseband. Filters are a critical component of the RFFE that selects the desired radio frequency signals and rejects unwanted signals and noise. For more information, please visit www.resonant.com.

About Resonant's ISN® Technology

Resonant can create designs for difficult bands and complex requirements that we believe have the potential to be manufactured for half the cost and developed in half the time of

traditional approaches. The Company's large suite of proprietary mathematical methods, software design tools and network synthesis techniques enable it to explore a much bigger set of possible solutions and quickly derive the better ones. These improved filters still use existing manufacturing methods (i.e. SAW) and can perform as well as those using higher cost methods (i.e. BAW). While most of the industry designs surface acoustic wave filters using a coupling-of-modes model, Resonant uses circuit models and physical models. Circuit models are computationally much faster, and physical models are highly accurate models based entirely on fundamental material properties and dimensions. Resonant's method delivers excellent predictability, enabling achievement of the desired product performance in roughly half as many turns through the fab. In addition, because Resonant's models are fundamental, integration with its foundry and fab customers is eased because its models speak the "fab language" of basic material properties and dimensions.

Safe Harbor/ Forward-Looking Statements

This press release contains forward-looking statements, which include the following subjects, among others: the capabilities of our filter designs, and the contributions to our solutions platform and the other consequences that may result from the ISN foundry program and the new ISN Foundry Agreement. Forward-looking statements are made as of the date of this document and are inherently subject to risks and uncertainties which could cause actual results to differ materially from those in the forward-looking statements, including, without limitation, the following: our limited operating history; our ability to complete designs that meet customer specifications; the ability of our customers (or their manufacturers) to fabricate our designs in commercial quantities; the ability of our designs to significantly lower costs compared to other designs and solutions; the risk that the intense competition and rapid technological change in our industry renders our designs less useful or obsolete; our ability to find, recruit and retain the highly skilled personnel required for our design process in sufficient numbers to support our growth; our ability to manage growth; and general market, economic and business conditions. Additional factors that could cause actual results to differ materially from those anticipated by our forward-looking statements are under the captions "Risk Factors" and "Management's Discussion and Analysis of Financial Condition and Results of Operations" in our most recent Annual Report (Form 10-K) or Quarterly Report (Form 10-Q) filed with the Securities and Exchange Commission. Forward-looking statements are made as of the date of this release, and we expressly disclaim any obligation or undertaking to update forward-looking statements.
